**Gulf and Franklin, Fla.** – Today, the Florida Department of Health in Franklin/Gulf reports new deaths of residents who previously tested positive for COVID-19. Franklin County has one new death and Gulf County has two new deaths. The Floridahealth.gov dashboard will show an overall total of 3 deaths in Franklin and 4 deaths in Gulf.

The Franklin County resident was a 71-year-old male. The Gulf County residents included an 82-year-old male and a 65-year-old female. The state's medical examiners are tasked with investigating and certifying COVID-19 deaths in the Florida, but we wanted to inform our rural counties about the situation as these new deaths will be reported on the state Floridahealth.gov dashboard. We would like to express our deepest sympathies to the family and loved ones of our residents.

The health of our residents remains our priority. In times of tragedy, our communities have always been a strong source of support for one another. We need our communities to help do everything they can to slow the spread of the virus.

-----

**ABOUT COVID-19**

COVID-19 transmission is more commonly spread from person to person through small droplets from the nose or mouth, including when an individual coughs or sneezes. This is why social distancing and keeping at least 6 feet between you and other people is still so important as well as wearing a mask in situations difficult to maintain social distancing. A person can get COVID-19 by touching droplets that can land on objects and surfaces and then touching their eyes, nose or mouth, although, this is a less common mode of transmission. The vast majority of cases have come from close, sustained contact with an individual with COVID-19.

People with COVID-19 have had a wide range of symptoms reported – ranging from mild symptoms to severe illness. Symptoms of COVID-19 include fever or chills, cough, shortness of breath, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, diarrhea. Symptoms may appear in as few as two days or as many as 14 days following exposure. Most people recover

from the COVID-19 without needing special treatment. The elderly and those with underlying medical problems like high blood pressure, heart problems and diabetes, and those with compromised immune systems are more likely to develop serious illness. There is currently no vaccine to prevent COVID-19. The best way to prevent illness is to avoid being exposed to this virus. As a reminder, the Department always recommends everyday preventive actions to help impede the spread of respiratory diseases, including:

- Avoiding close contact with people who are sick;
- Staying home when you are sick and avoiding contact with persons in poor health;
- Avoiding touching your eyes, nose and mouth;
- Covering your cough or sneeze with a tissue, then disposing of the tissue;
- Wear cloth masks in public situations difficult to maintain social distancing;
- Washing your hands often with soap and water for at least 20 seconds, especially after going to the bathroom, before eating, after blowing your nose, coughing or sneezing;
  - If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty; and
- Cleaning and disinfecting frequently touched objects and surfaces using a regular household cleaning spray or wipe.
